

Lens effects as an upstream corpus diagnostic

Motivated corpus preparation leaves measurable, graded structure before optimization begins.

Pretraining corpora

broad source-derived mixtures
compact within-panel geometry
lower concentration

Post-training corpora

trainer-selected responses
structured departures
capability and safety poles

Measurement suite

lexical mass allocation
salience-rank preservation
embedding-neighborhood shift
spectral concentration
redundancy and mixture paths

Diagnostic output

stage-linked separation
internal post-training structure
positioning for new corpora
public scorecard submissions
